This is an update of the authors’ 6 April 2009 column comparing today’s global crisis to the Great Depression. World industrial production, trade, and stock markets are diving faster now than during 1929-30. Fortunately, the policy response to date is much better. The update shows that trade and stock markets have shown some improvement without reversing the overall conclusion -- today's crisis is at least as bad as the Great Depression.

Editor's note: The 6 April 2009 Vox column by Barry Eichengreen and Kevin O'Rourke shattered all Vox readership records, with 30,000 views in less than 48 hours and over 100,000 within the week. The authors will update the charts as new data emerges; this updated column is the first, presenting monthly data up to April 2009. (The updates and much more will eventually appear in a paper the authors are writing a paper for Economic Policy.)

New findings:

• World industrial production continues to track closely the 1930s fall, with no clear signs of ‘green shoots’.

• World stock markets have rebounded a bit since March, and world trade has stabilized, but these are still following paths far below the ones they followed in the Great Depression.

• There are new charts for individual nations’ industrial output. The big-4 EU nations divide north-south; today’s German and British industrial output are closely tracking their rate of fall in the 1930s, while Italy and France are doing much worse.
• The North Americans (US & Canada) continue to see their industrial output fall approximately in line with what happened in the 1929 crisis, with no clear signs of a turn around.

• Japan’s industrial output in February was 25 percentage points lower than at the equivalent stage in the Great Depression. There was however a sharp rebound in March.

The facts for Chile, Belgium, Czechoslovakia, Poland and Sweden are displayed below; note the rebound in Eastern Europe.
